

Order ahead sketches

This is the food page. The restaurant cards look similar to the current food page with the exception of the removal of the restaurant icons on each card.

Underneath the "Food" title are two tabs which separate restaurants between restaurants that use the order ahead feature and the restaurants that only allow customers to order food from within their store.

The top left icon is the profile icon which allows the user to view and update their personal information.

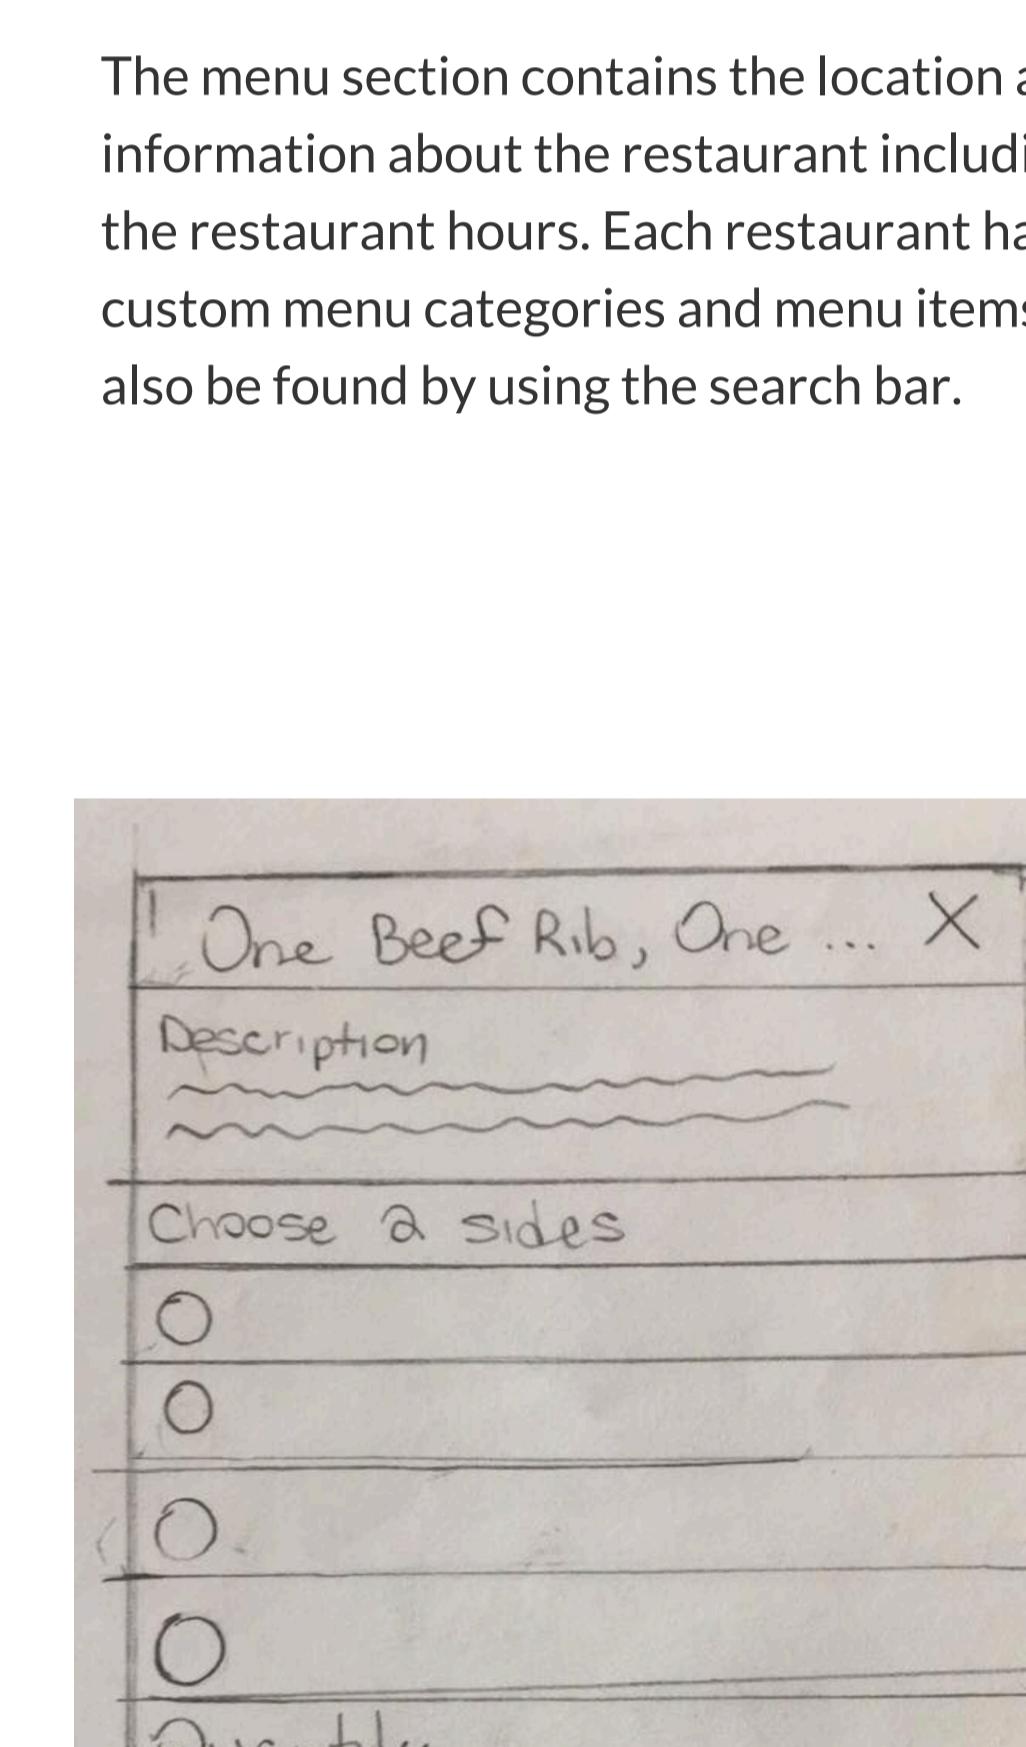

This is the profile page which is accessed by selecting the profile icon on the Food page. Users can update their name, phone number, payment method, and email address. The fields with a pencil icon listed next to it means that the user can update that field while on the current screen instead being brought to a new page.

Users can also update their settings.

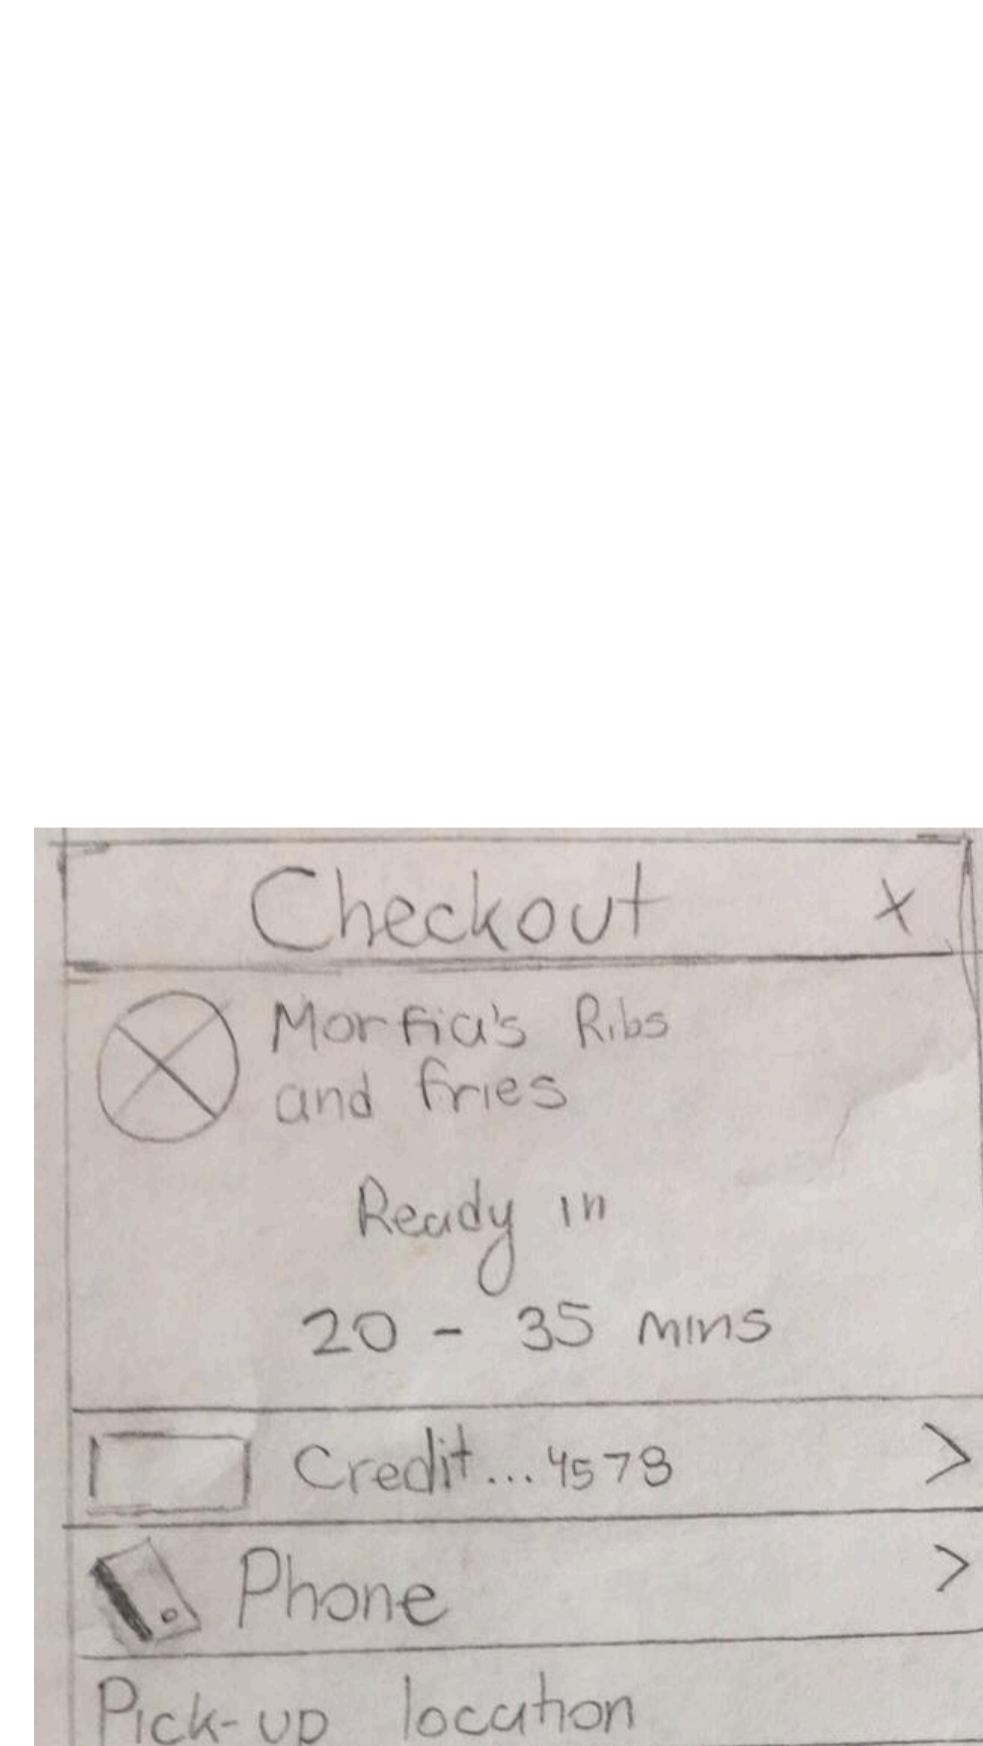

This is the payment method page. The user can either scan their credit card to have their information auto filled, or they can input their card information manually. Once they select "save card" their card will be used for future orders.

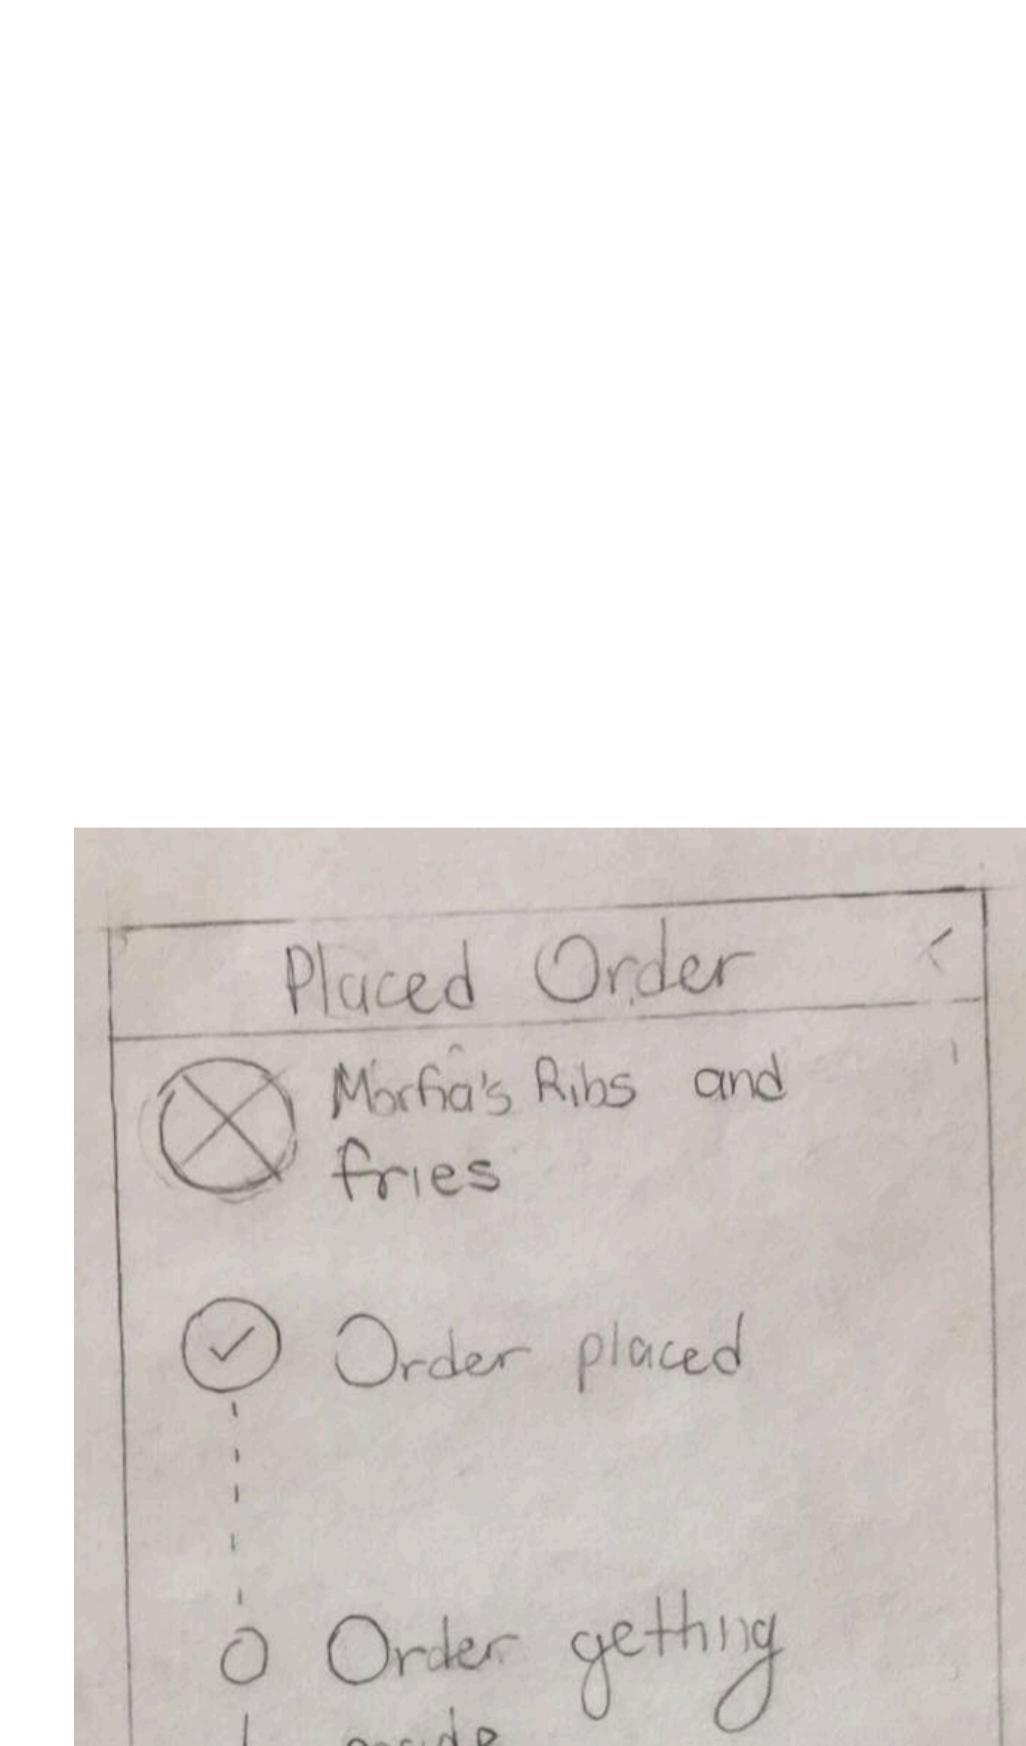

This is the restaurant page. There are three tabs to help users navigate the page: Menu, Credit, and Activities.

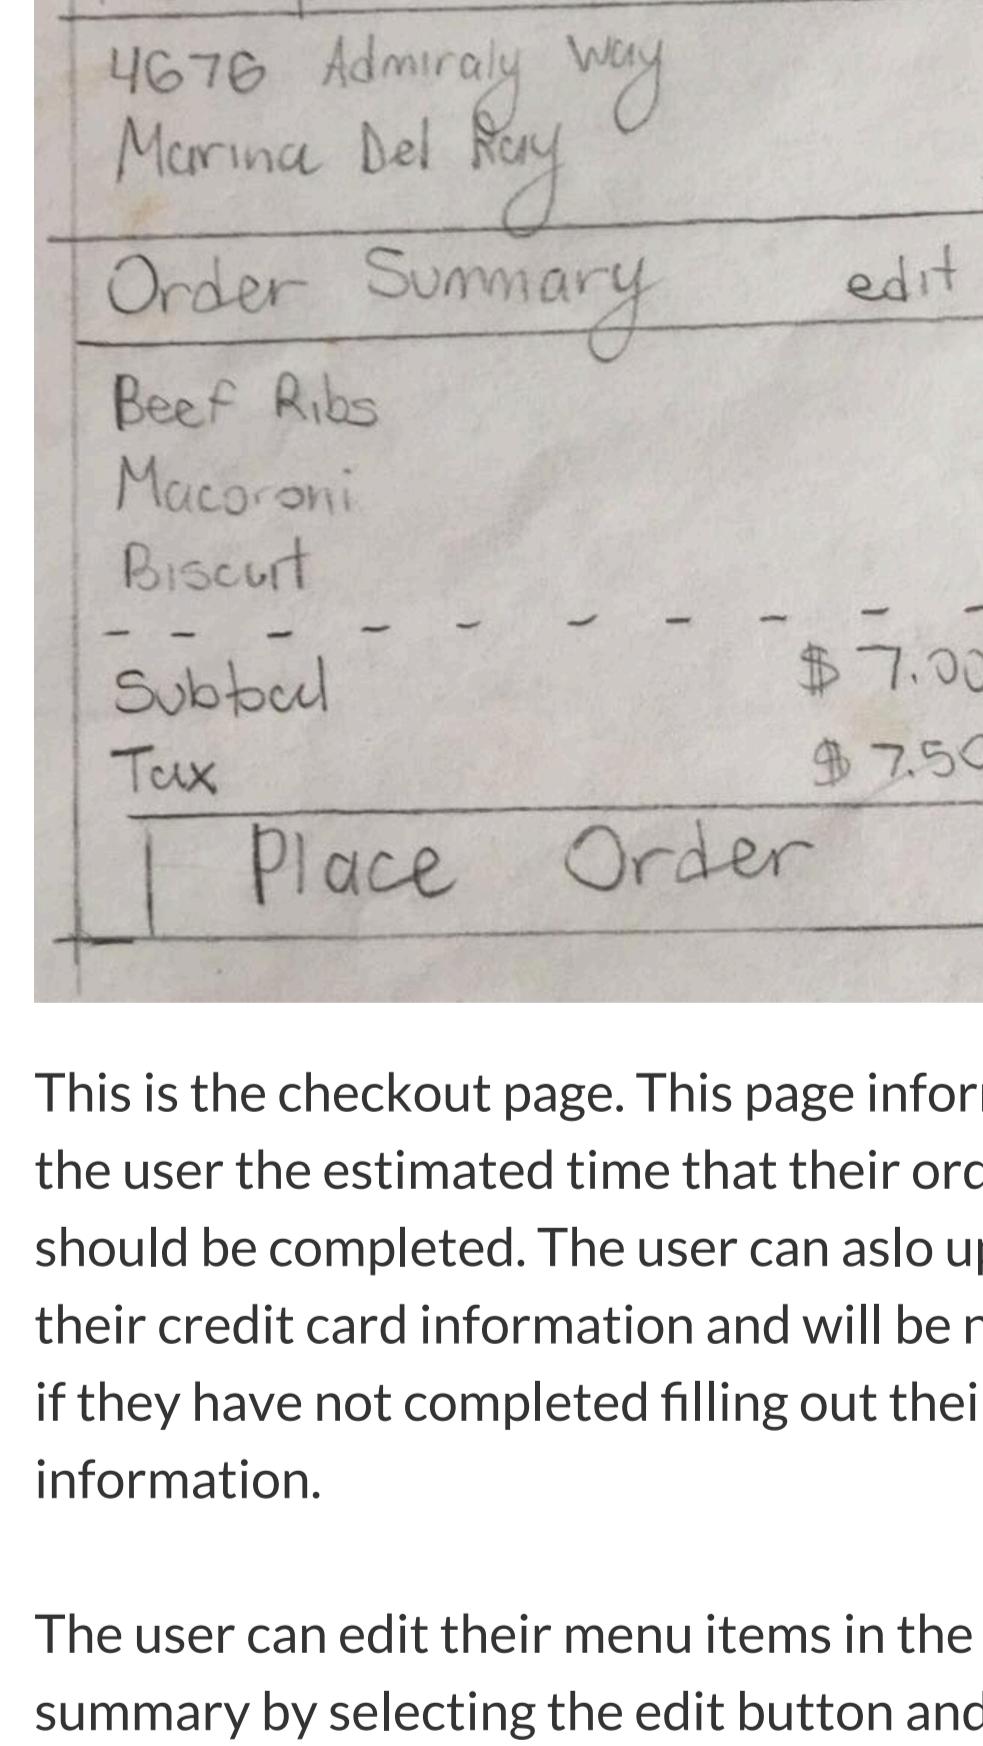

The menu section contains the location and information about the restaurant including the restaurant hours. Each restaurant has a custom menu categories and menu items can also be found by using the search bar.

This page lists the types of meals listed in the chosen category. The information includes the ingredients of each meal and its cost.

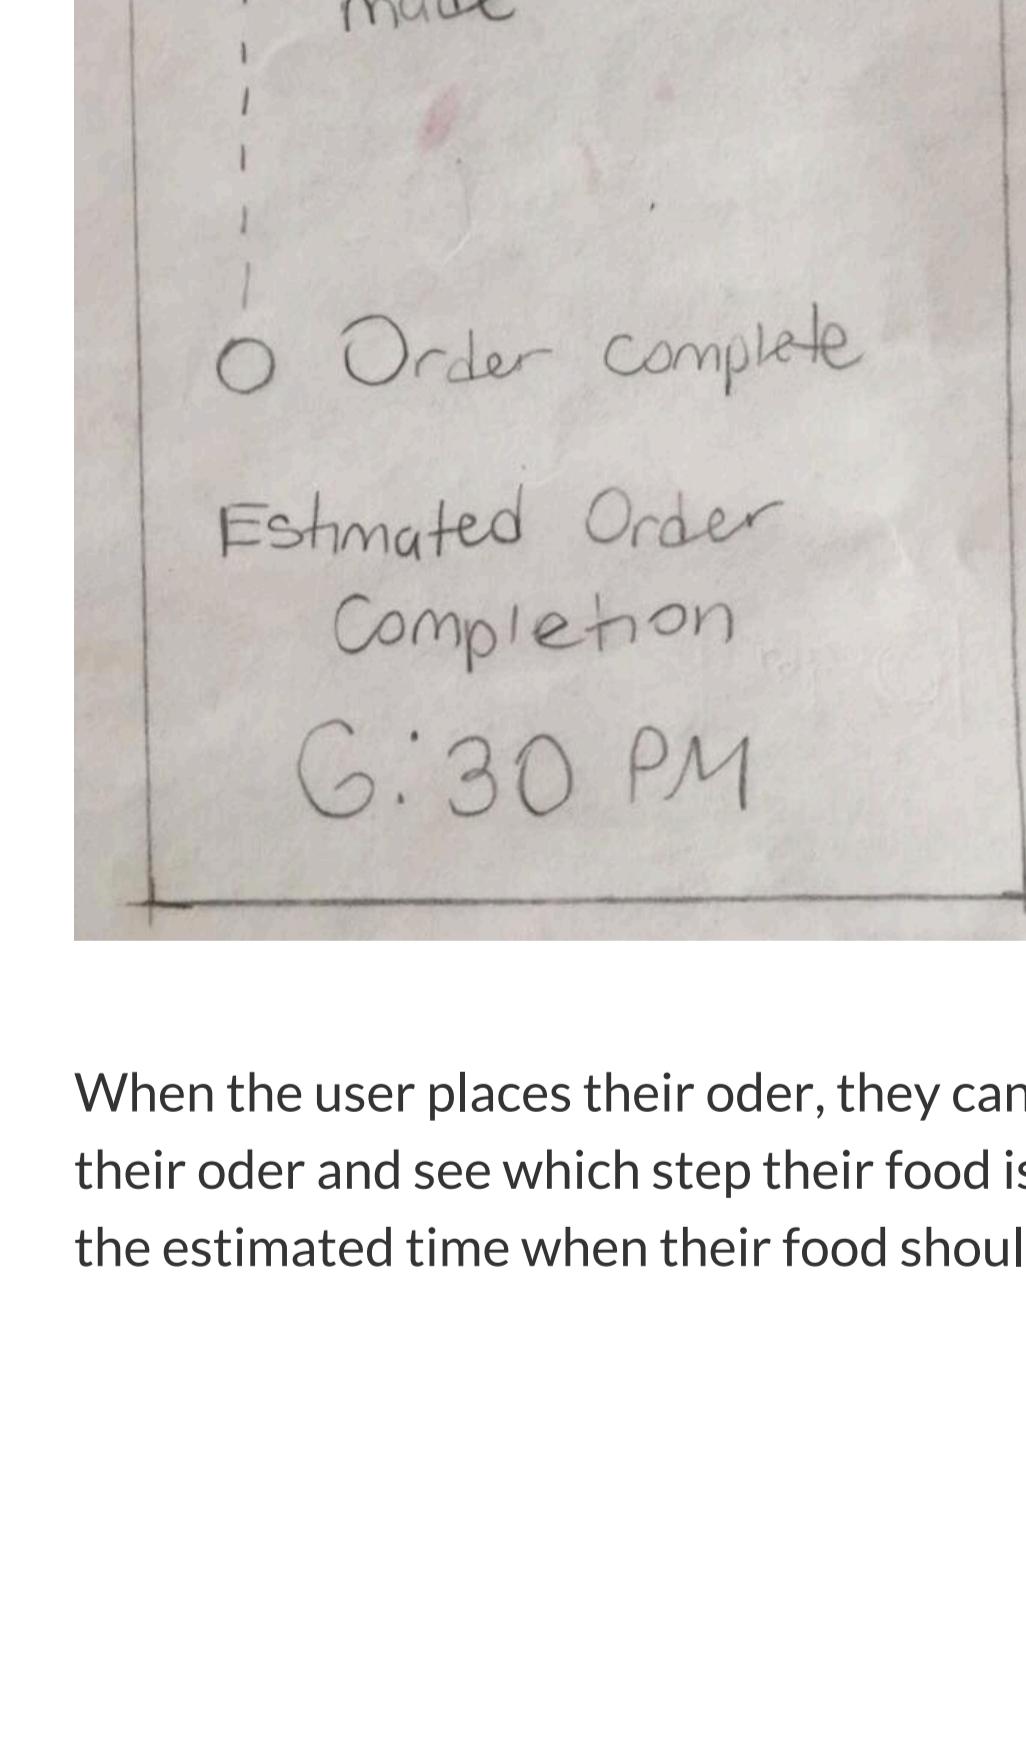

Once the user selects the menu item they want, they can choose the details of their order and enter special instructions.

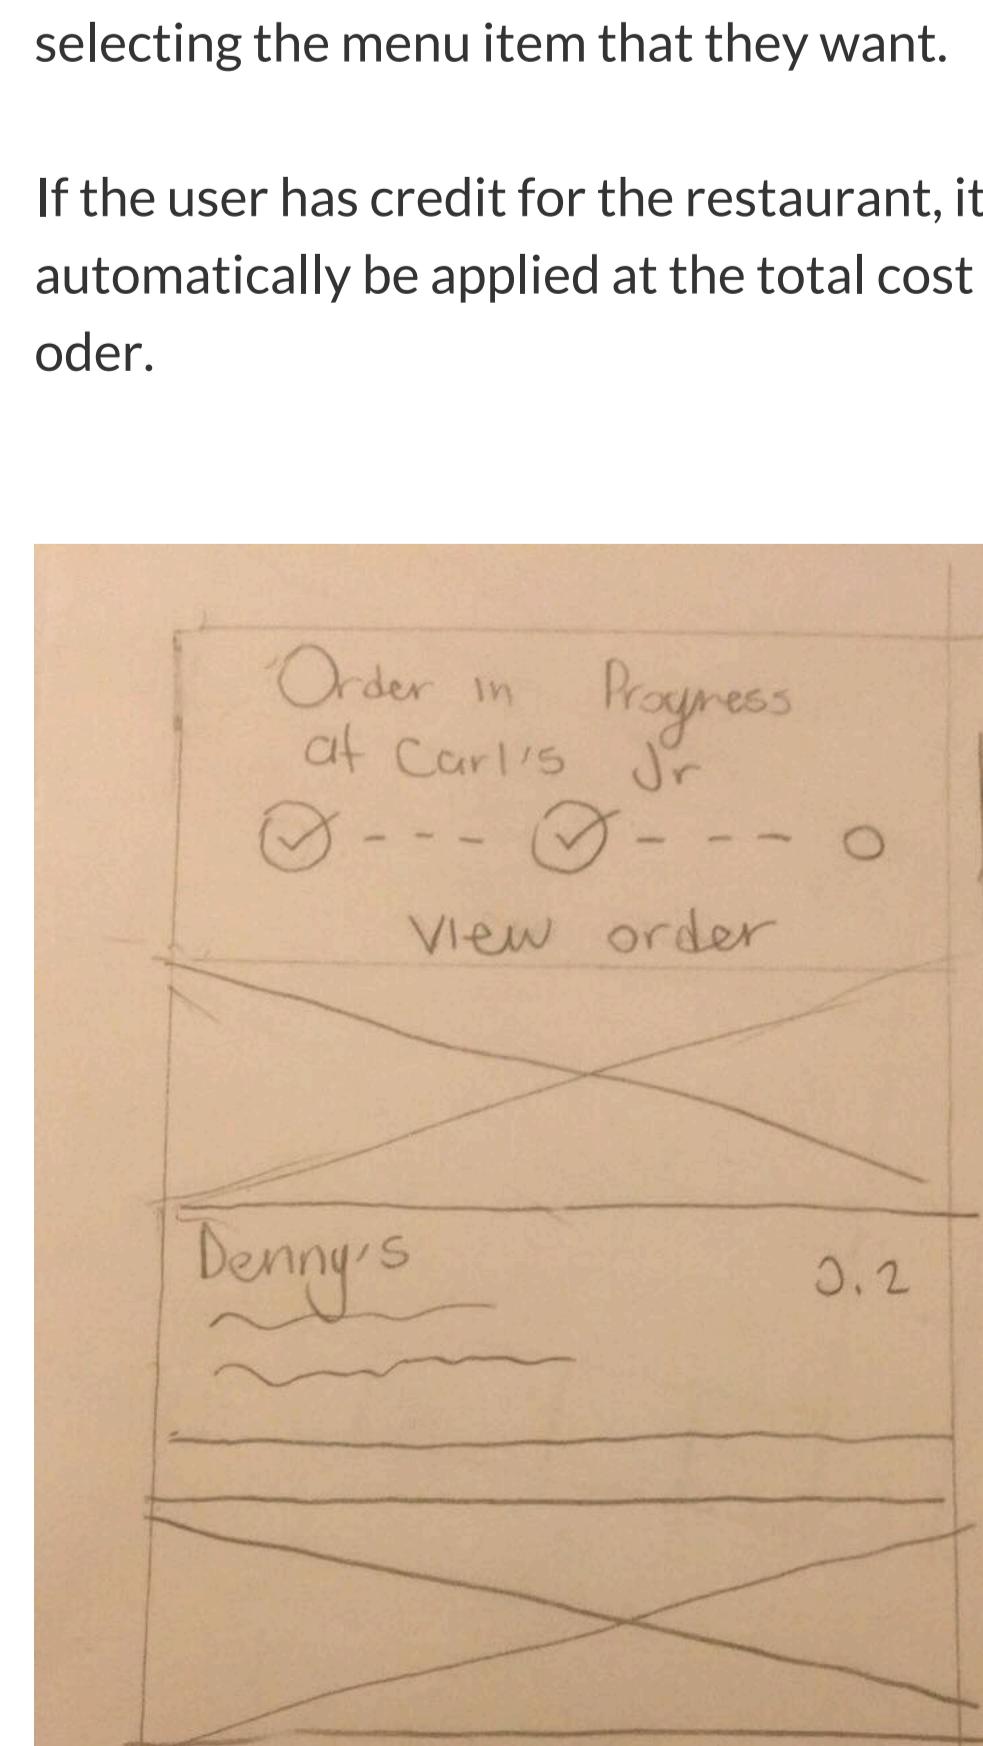

This is the checkout page. This page informs the user the estimated time that their order should be completed. The user can also update their credit card information and will be notified if they have not completed filling out their card information.

The user can edit their menu items in the order summary by selecting the edit button and selecting the menu item that they want.

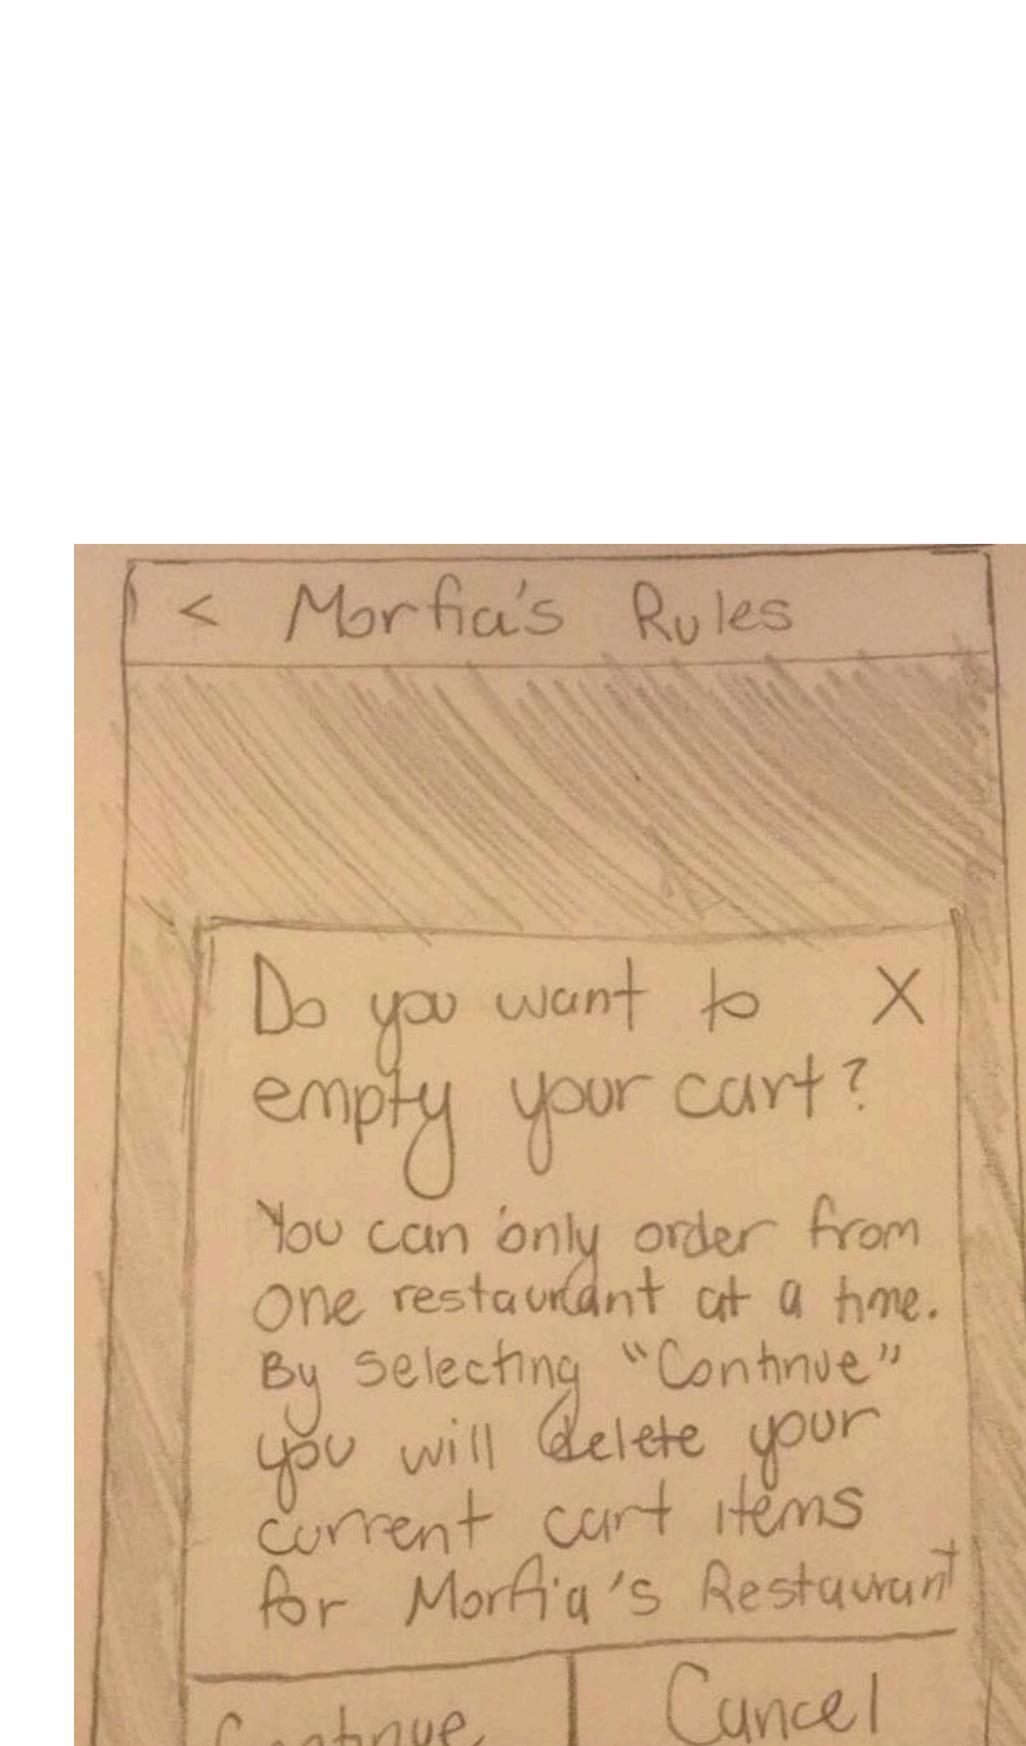

If the user has credit for the restaurant, it will automatically be applied at the total cost of their order.

When the user places their order, they can track their order and see which step their food is at and the estimated time when their food should be ready.

If the user exits the app and their order is still in progress, their order will be placed as a sticky header on the food page.

The user will be notified if they try to order from another restaurant.
